

# **RHESSI investigation of HXR coronal sources during decay phase of solar flares: I. observations**

T. Mrozek, Z. Kołtun, S. Kołomański, U. Bąk-Stęślicka  
Astronomical Institute  
University of Wrocław

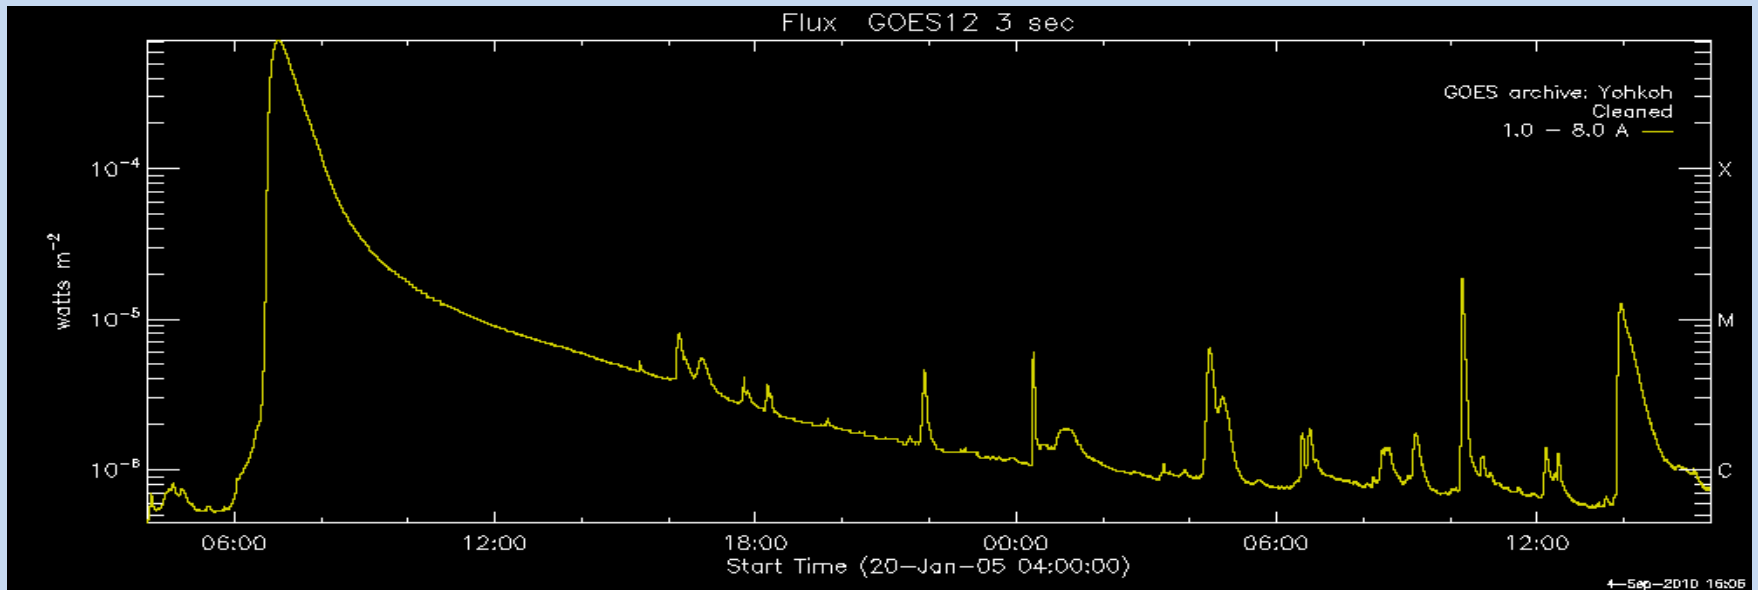

# definitions

- Long Duration Events (LDE)** – large structures, slowly evolving during decay phase; last up to several dozen hours; high temperatures (Skylab, Yohkoh observations) can be explain only if the energy is continuously released during decay phase
- Loop top sources (LTS, LTK)** – regions of emission, located close to the top of flaring loop; except the impulsive phase their emission is dominant; internal structure is unknown.

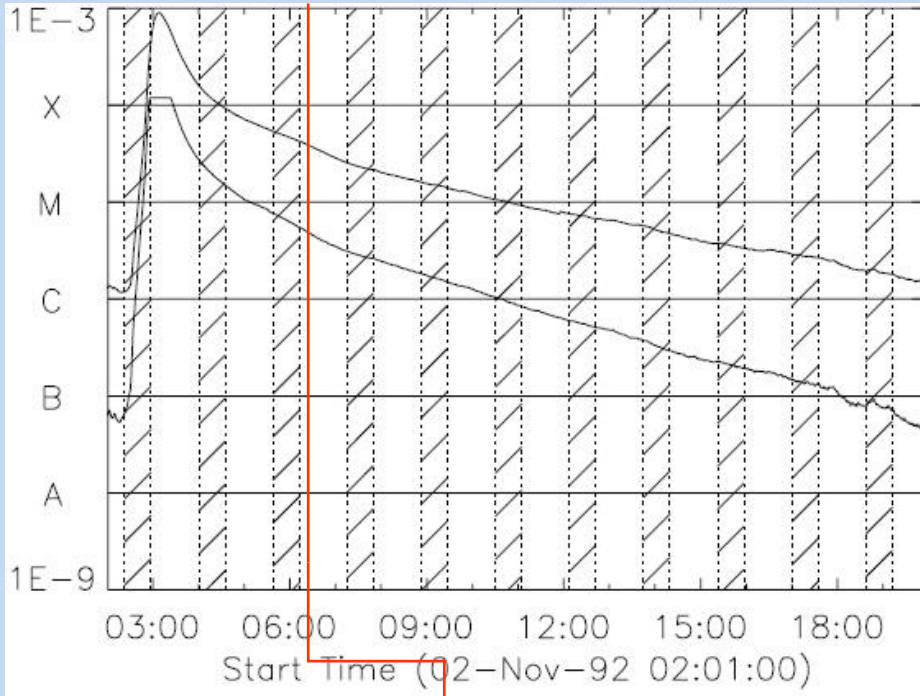

# why LDE?

- Existence of LDE is a great challenge for flare models (long durations, hours of energy release)
- Present models of a solar flare show that LTS should be locate very close to the energy release site

# results (Yohkoh)

**02.11.1992, X9.0**  
**Harra-Murnion et al. (1998)**

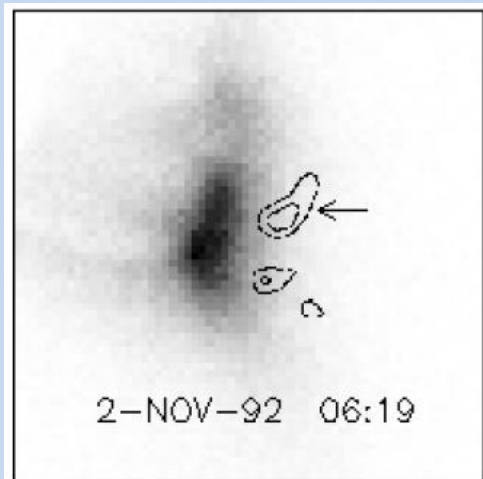

**-over 21h of decay in SXR**

**-HXR emission observed 3 hours after the maximum (14-23 keV)**

**-source of HXR emission located close, above the source of SXR emission**

**-observed HXR source is large: 20-45''**

**-the LTS is larger and observed higher in the corona for consecutive time intervals**

# results (Yohkoh)

27.04.1998, X1.0  
Kołomański (2007)

-over 20h of decay in SXR

-HXR emission observed 50 min. after  
the maximum (14-23 keV)

-source of HXR emission located close  
above the source of SXR emission

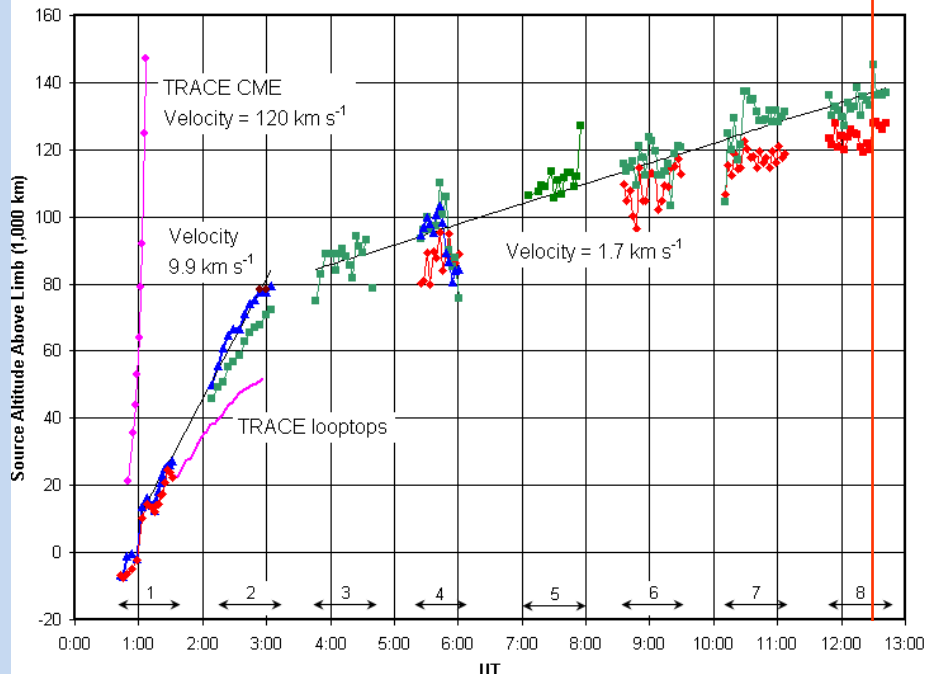

-unknown nature of HXR source (insufficient  
spectral resolution)

# results (RHESSI)

X1.5 Flare on 21 April 2002  
Altitude of source centroid above limb

-12h of decay in SXR range

- emission sources of energy 3-6keV  
and 6-12 keV observed 11 h after  
maximum

-altitude of the source is rising with time

-source is large: 20''

# why RHESSI?

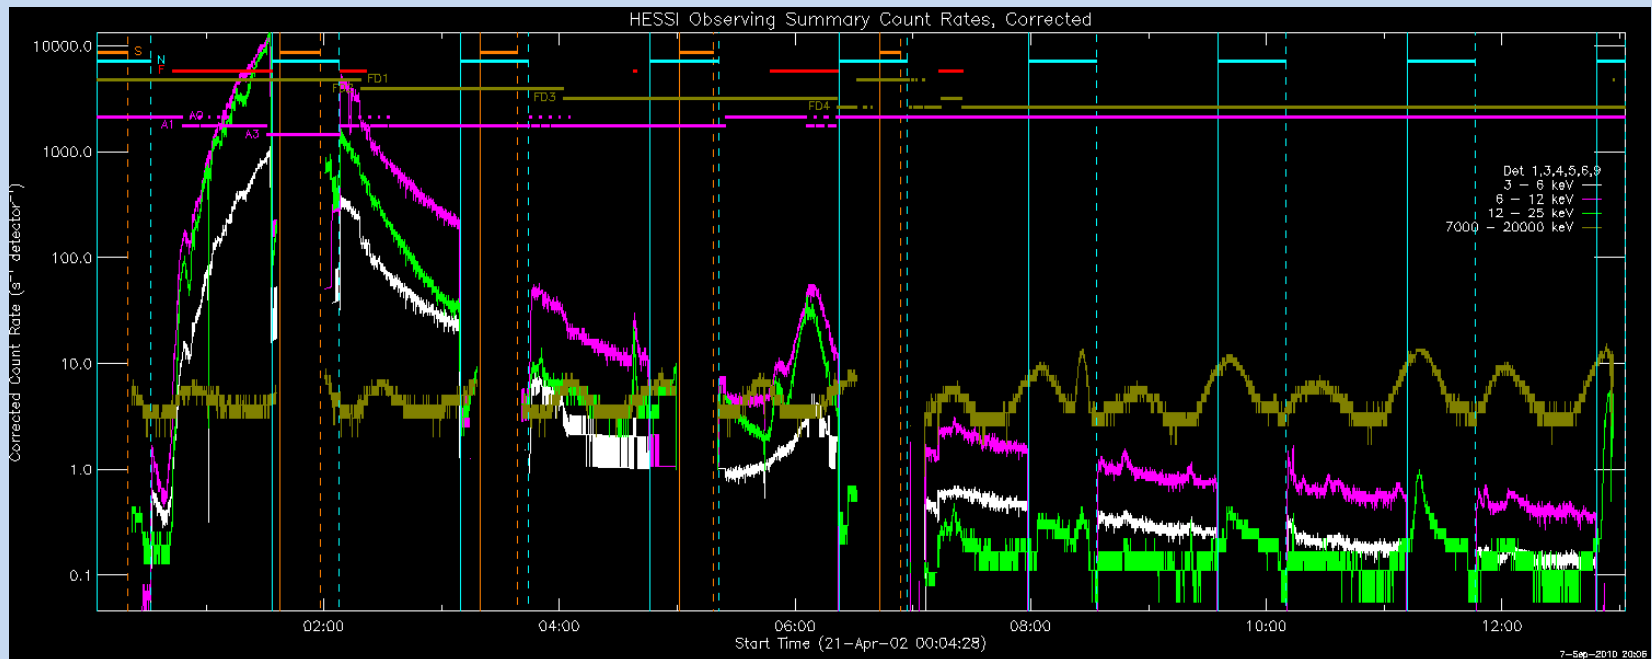

## Pros:

- spatial resolution
- dynamical range
- sensitivity
- spectral resolution

## Cons:

- pile-up
- attenuators
- orbital background (SAA, radiation belts)

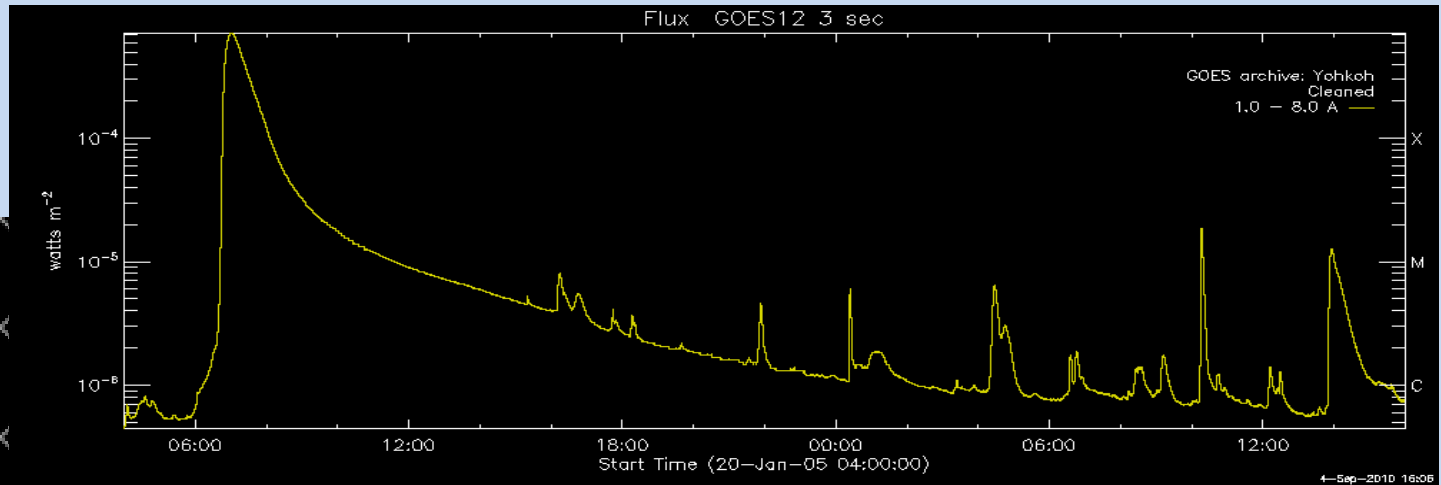

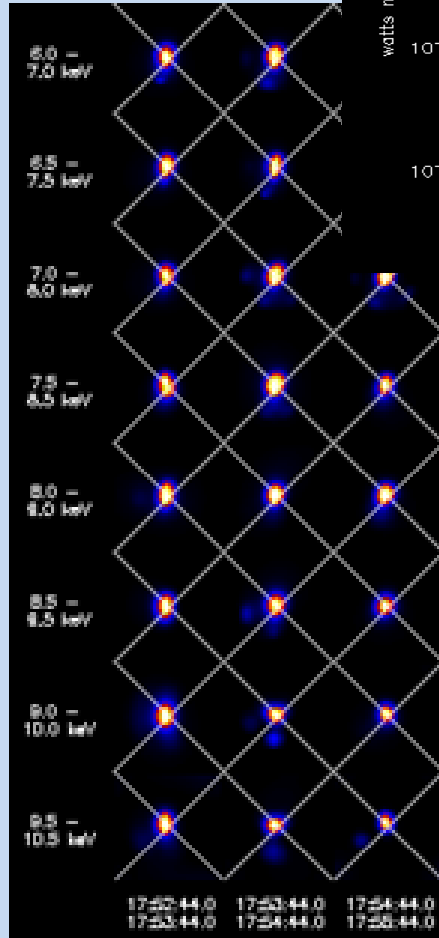

**High diversity: location, class, duration**

# method

**For a group of events we reconstructed images with 1 keV energy resolution**

**Images were reconstructed as far as was possible with this energy resolution**

**Image spectroscopy for observed sources - temperature and emission measure**

**Estimation of other parameters like altitude, size**

**The problem: sources are very weak**

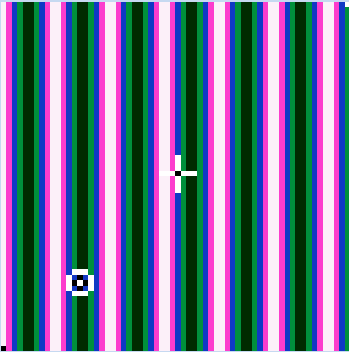

# RHESSI and weak sources

-9 pairs of grids of different slits size

-9 germanium detectors measuring energy and time for each photon

-rotation of a satellite, ~15 times per minute

rotation of a grid

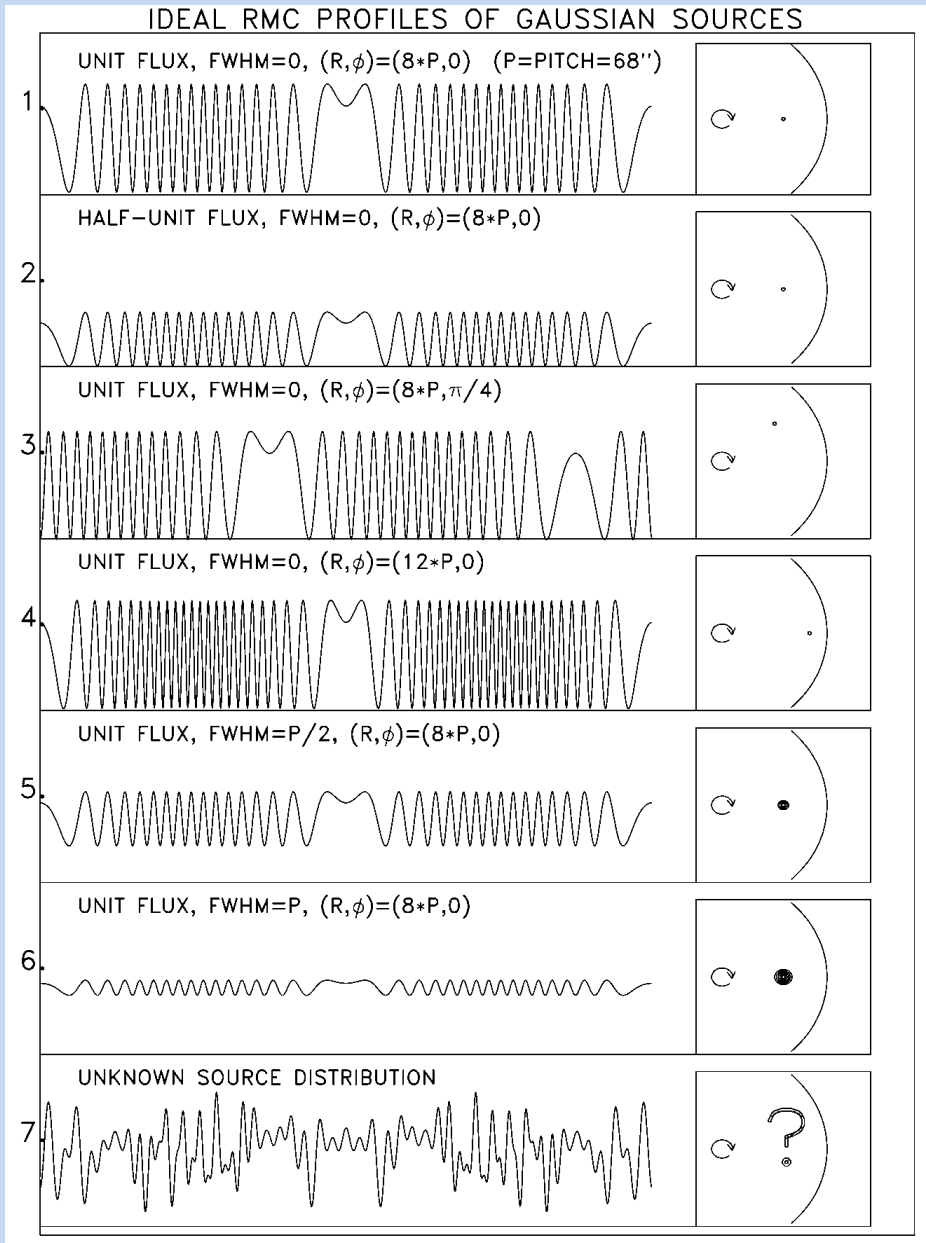

pairs of rotating grids cause changes in transmission function

thus, the detector measures only changes of intensity

changes of intensity + time = modulation pattern

intensity + position angle of grid for different times = image

# RHESSI and weak sources

← point source, unit flux

← point source, half-unit flux

← point source, position change (angle)

← point source, position change (radial)

← size of the source = pitch/2

← size of the source = pitch

Source too large for given pitch will not produce a modulation

# RHESSI and weak sources

6

7

8

9

**For image reconstruction we took only grids which show reliable sources**

**Such flexible-grid method greatly improves convergence of the reconstruction**

**Similar method is used in the ForwardFitting method, but it estimates shapes with arbitrary, simple figures – for single source it is the best method for estimating the size (we used it to verify PIXON results)**

# main problem: size

grid  
number

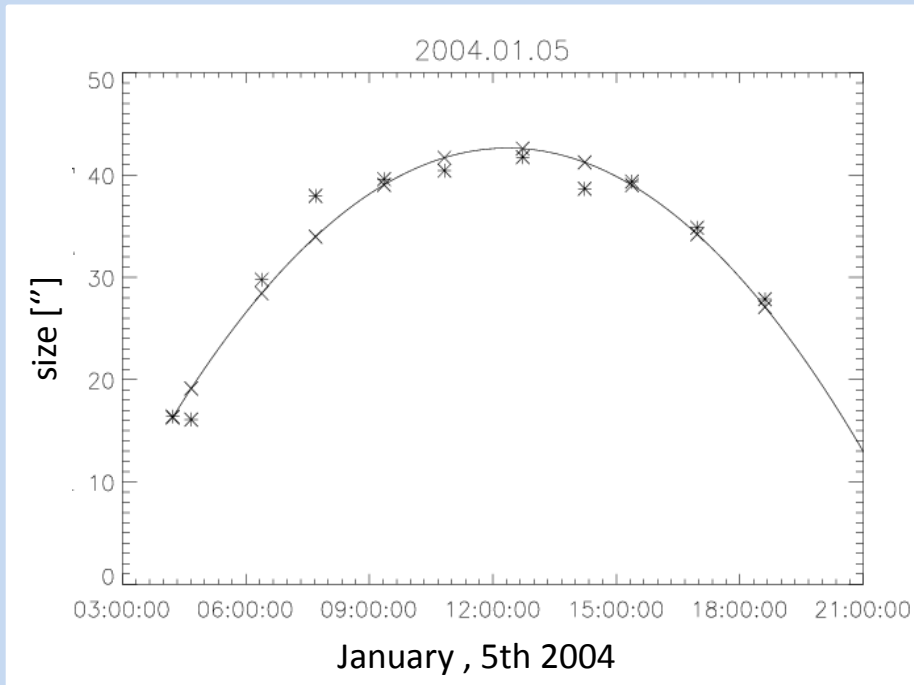

the size of  
the source  
or a weak  
signal?

if size then  
from FWHM  
of grid we  
have lower  
boundary of  
size estimation

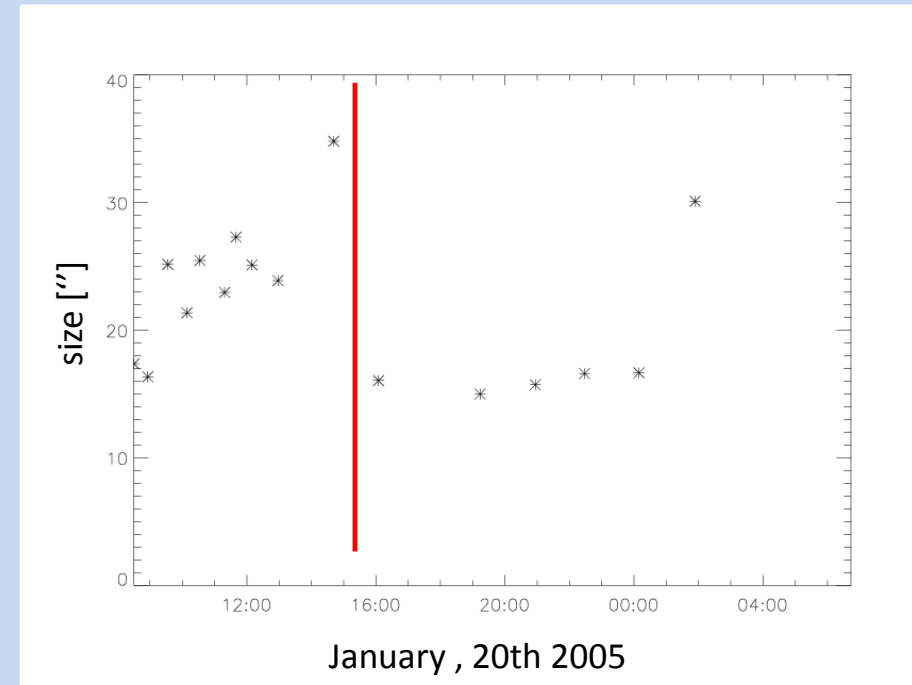

low signal is not  
a problem if we  
take longer  
integration  
times

time

# main problem: size

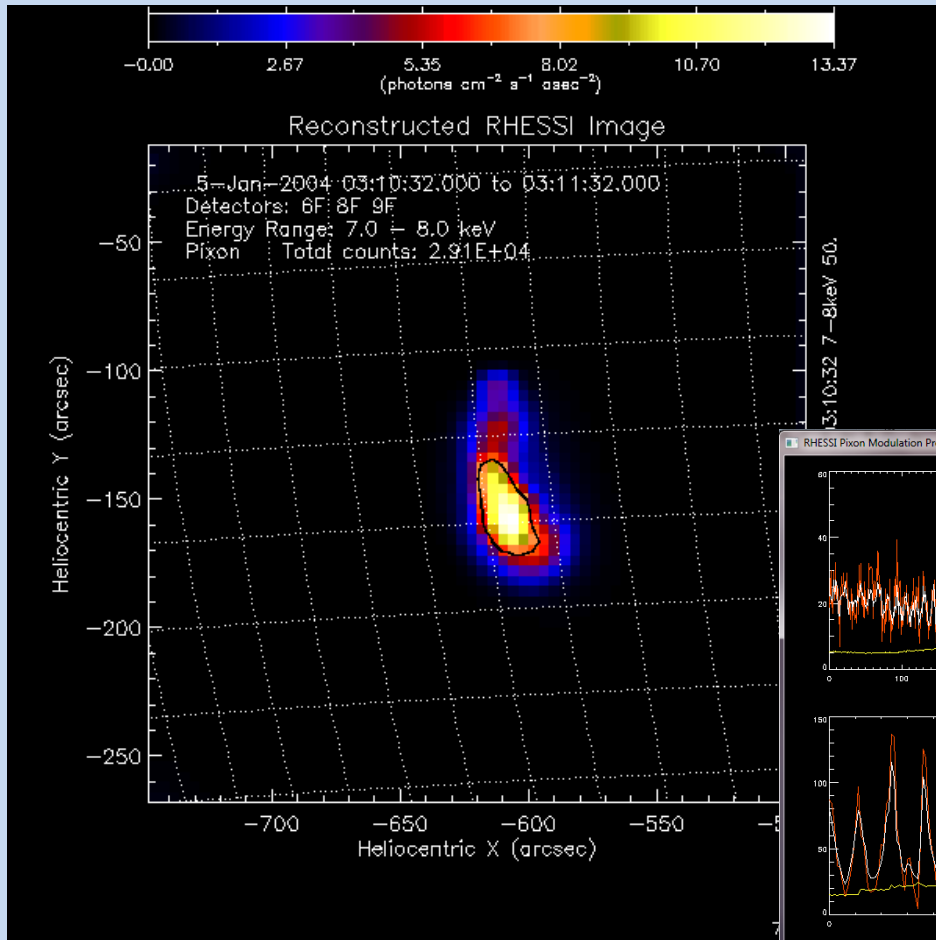

**No attenuators. The source is weaker, but measured size is lower – size is well controlled by choosing different grids**

**Attenuator change (A1-A0) causes drastic change in measured size (finer grid show modulation again). For A1 state the dominant is weak signal.**

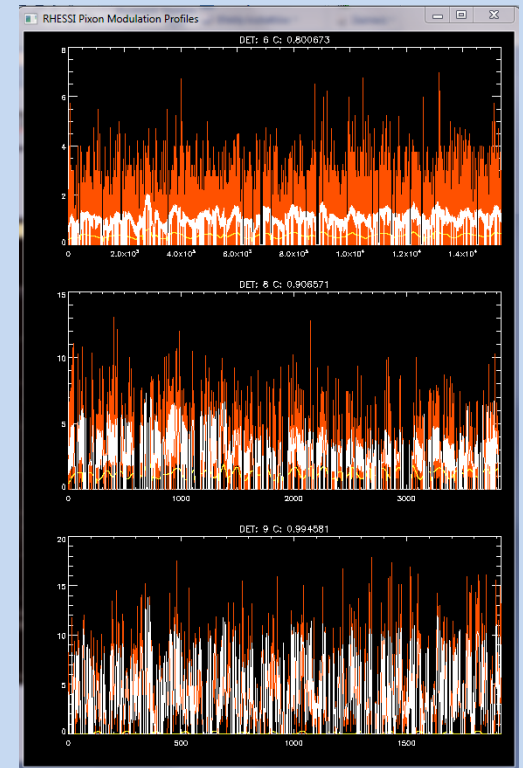

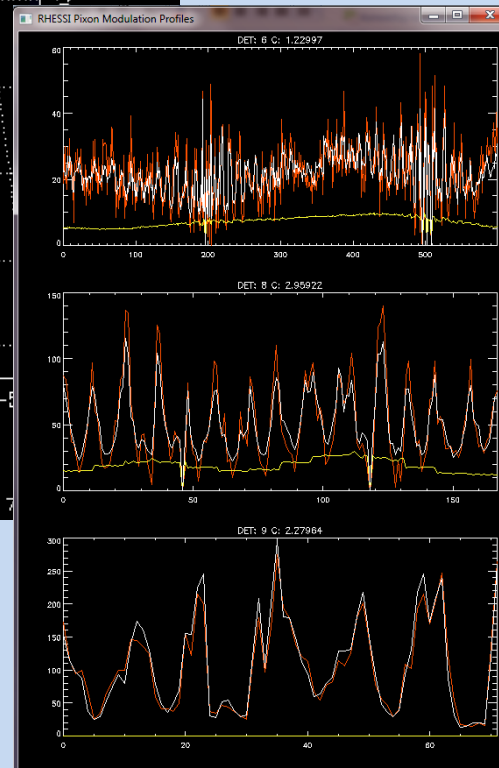

# image reconstruction: parameters

## PIXON parameters:

- background model
- phase stacker (for long integration times)
- uniform weighting

Size – area within a contour of 50% of brightest pixel. Eventually compared to Vis Ffit.

# an example: 21 Aug 2005

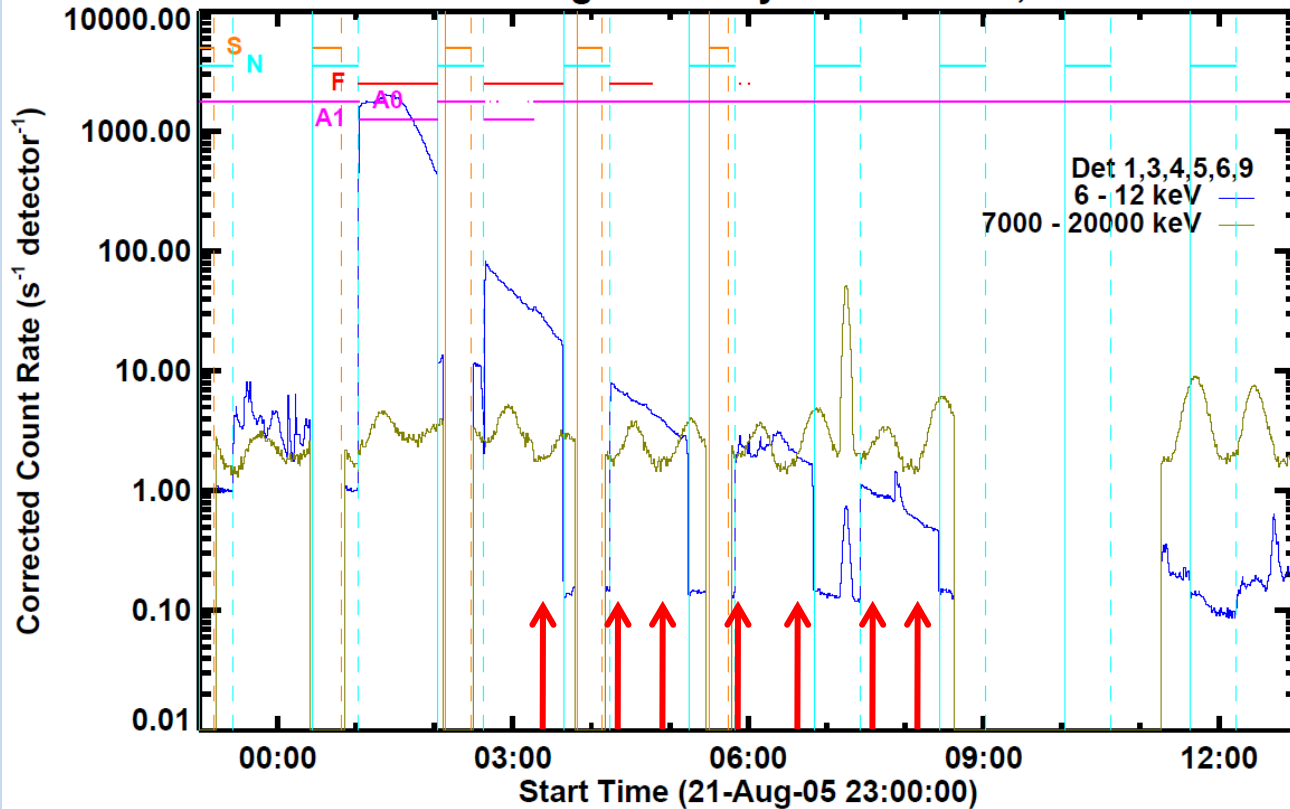

date: **21.08.2005**  
AR: **10798**  
location: **S10 W54**  
class: **M2.6**  
start: **~0:40 UT**  
max.: **1:33 UT**  
decay: **~10.5 h**

# an example: 21 Aug 2005

## HESSI Observing Summary Count Rates, Corrected

### Image reconstruction

grids from 5th to 9th  
(except 7th)

method: PIXON

time intervals: 1-8 min

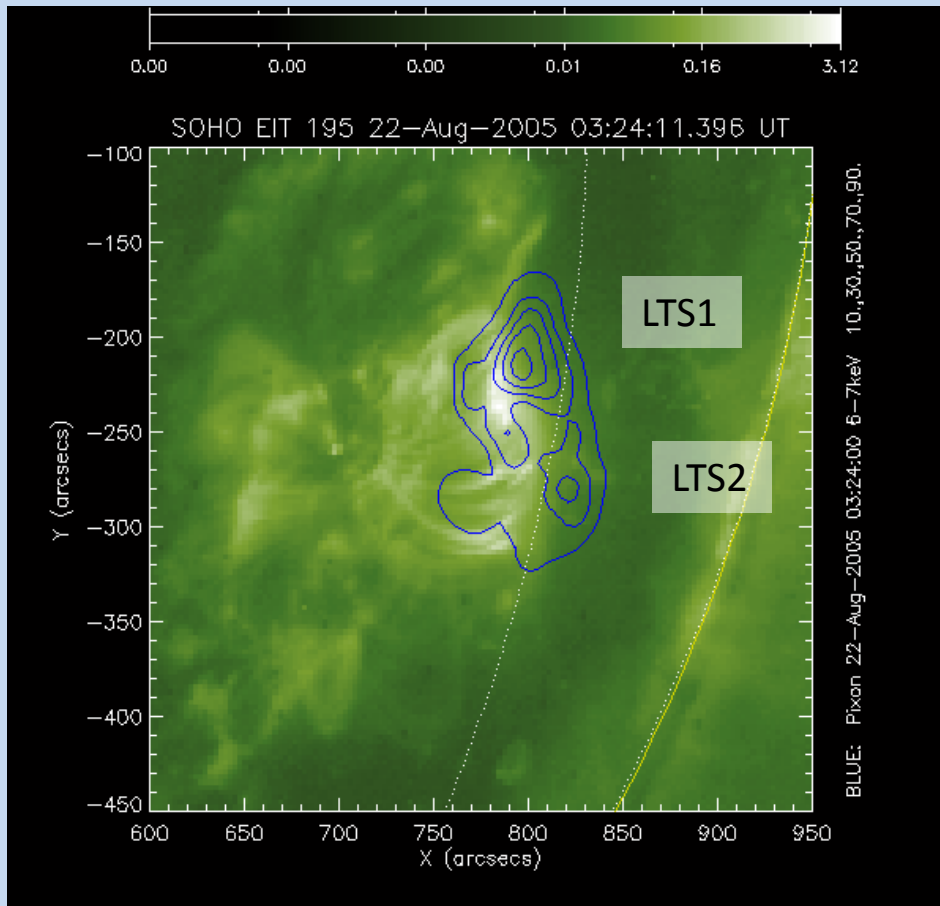

energy resolution: 1 keV

# an example: 21 Aug 2005

# an example: 21 Aug 2005

08:08 UT

EIT 195 Å

RHESSI (6-7 keV, contours 10%, 30%, 50%, 70%, 90%)

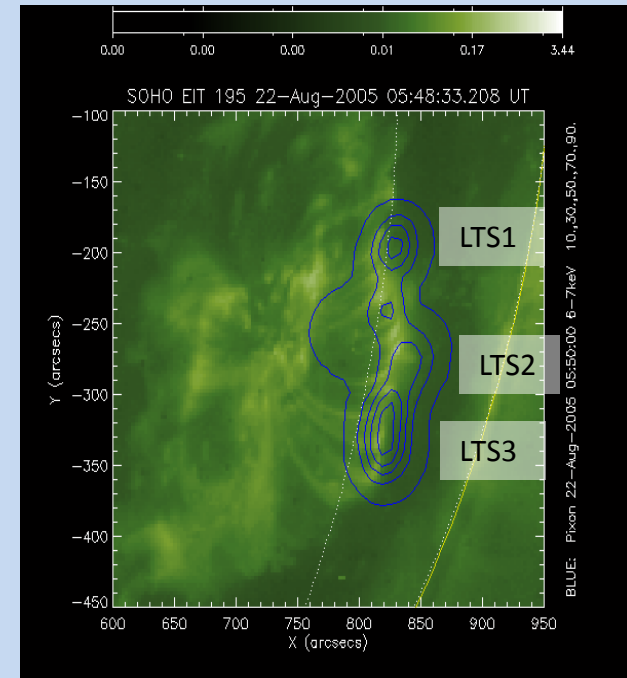

# an example: 21 Aug 2005

## goals:

- nature of a source
- geometry
- physical parameters
- energy balance

fitted with thermal+lines model

# *an example: 21 Aug 2005*

## **LTS1:** physical and geometrical parameters

	<b>03:24</b>	<b>04:22</b>	<b>04:46</b>	<b>05:50</b>
h [Mm]	36.4	44.4	47.5	53.3
T [MK]	12.3	11.1	10.2	9.9
EM [ $10^{47} \text{ cm}^{-3}$ ]	3.8	1.6	1.4	0.5
r [Mm]	8.8	12.0	11.9	8.7
N [ $10^9 \text{ cm}^{-3}$ ]	7.2	3.0	2.8	2.7

## **LTS2:** physical and geometrical parameters

	<b>03:24</b>	<b>04:22</b>	<b>04:46</b>	<b>05:50</b>
h [Mm]	59.5	79.4	73.8	77.0
T [MK]	12.3	11.2	9.9	10.0
EM [ $10^{47} \text{ cm}^{-3}$ ]	3.5	1.8	1.8	0.5
r [Mm]	4.7	6.4	8.8	6.8
N [ $10^9 \text{ cm}^{-3}$ ]	17.9	8.0	5.0	3.9

# *an example: 21 Aug 2005*

## **LTS3: physical and geometrical parameters**

	<b>05:50</b>	<b>06:36</b>	<b>07:29</b>	<b>08:08</b>
h [Mm]	82.0	76.2	81.2	81.5
T [MK]	12.4	11.1	9.2	9.9
EM [ $10^{47} \text{ cm}^{-3}$ ]	0.23	0.82	0.71	0.85
r [Mm]	9.8	25.3	28.0	31.1
N [ $10^9 \text{ cm}^{-3}$ ]	1.5	0.69	0.55	0.52

Very large size for late phase. Probably overestimated.

# *results: decay times*

Ranges present first and last of obtained values

Non-thermal component is very weak and steep (gamma between values of 8.5 and 10.0) and is observed within the same region

## *conclusions*

---

**LDEs are well observed by RHESSI. The analysis is complicated due to attenuators, radiation belts, SAA, but not impossible.**

**The size of X-ray sources is most uncertain parameter. However, there is no doubt that sources are large structures and grow with time.**

**Long-lasting X-ray sources are located above structures observed in the EUV range.**

**Usually the sources are dominated by thermal emission. Non-thermal component is weak and very steep.**

**Obtained observational values give strong and demanding constraints for models of a solar flare .**

**The observed features demand the existence of the energy release process lasting several hours.**
